

Installing IDE for MacOS

1. Go to the location where the IntelliJ is downloaded.

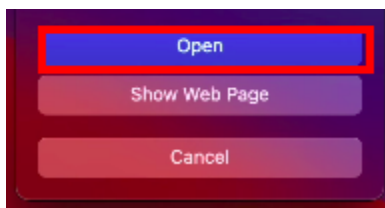

2. Select and open the file.

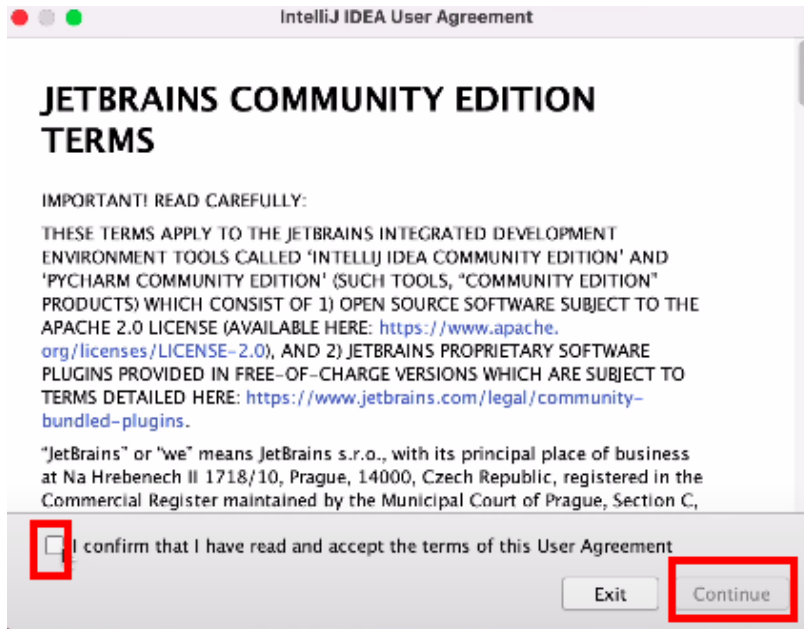

3. Next drag IntelliJ to the application if you want to create a desktop shortcut.

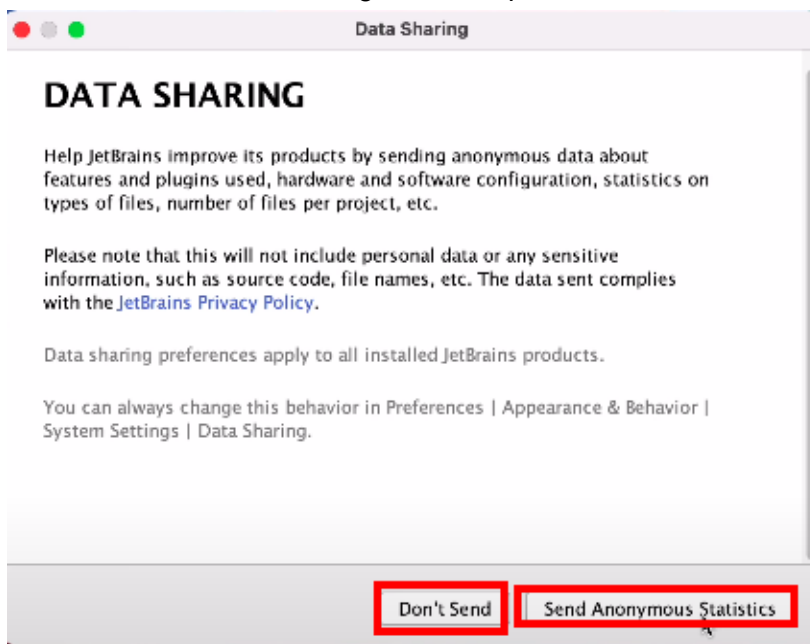

Next: Click on open

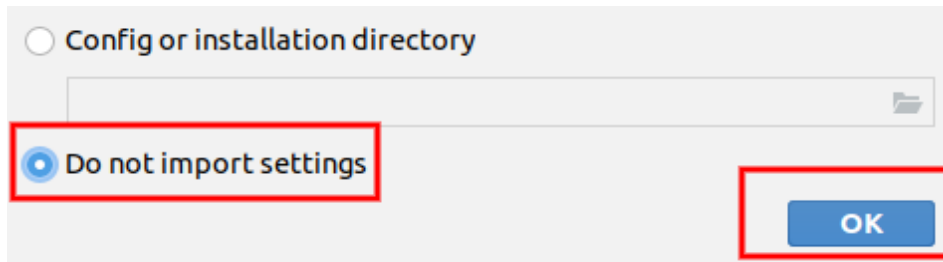

4. Next tick the checkbox and continue.

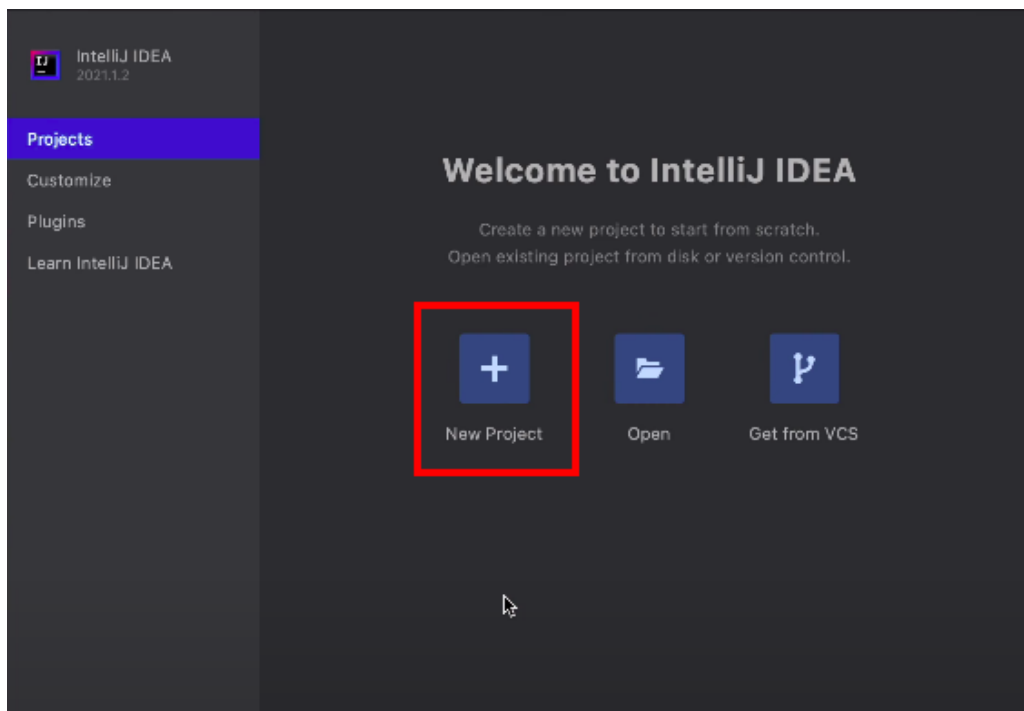

5. Next, select the data sharing notice as per convenience.

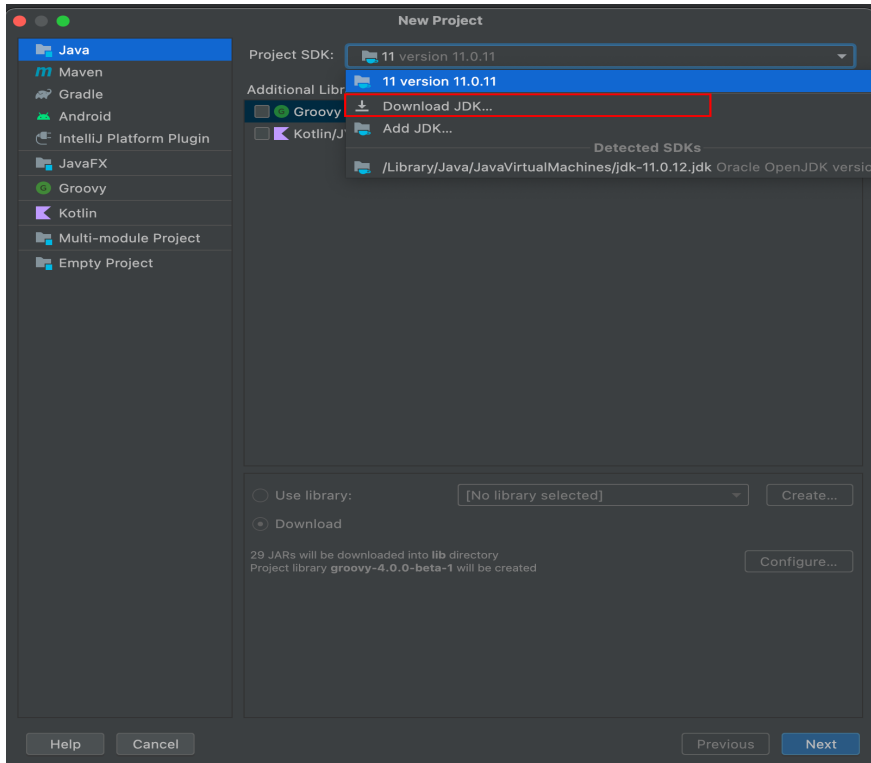

6. Choose do not import settings and click ok. This may or may not appear while installation (Optional).

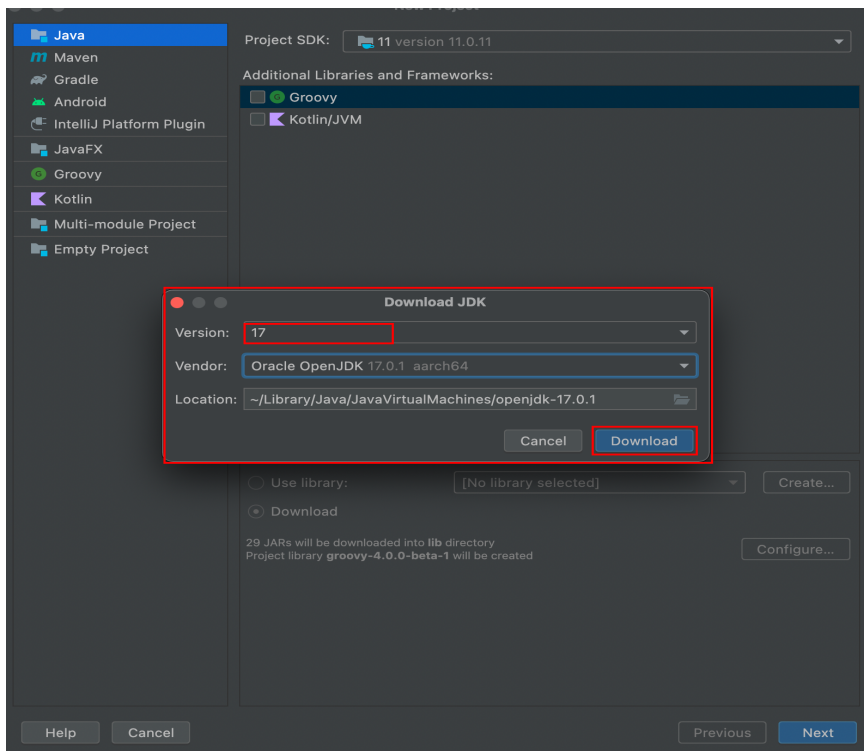

7. Further, you will see a screen below. Click on the new Project.

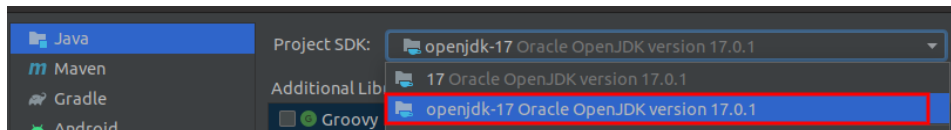

8. Next you need to select on download JDK as you have not downloaded any JDK in previous segments.

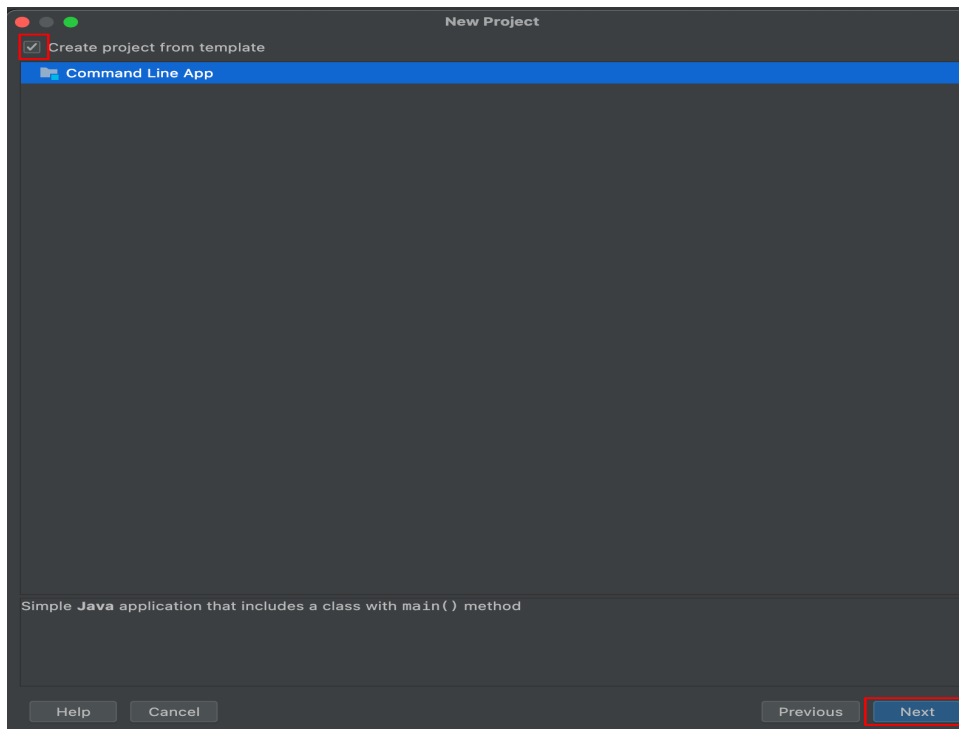

9. Download the JDK version 17 as shown and click download. The downloading will start.

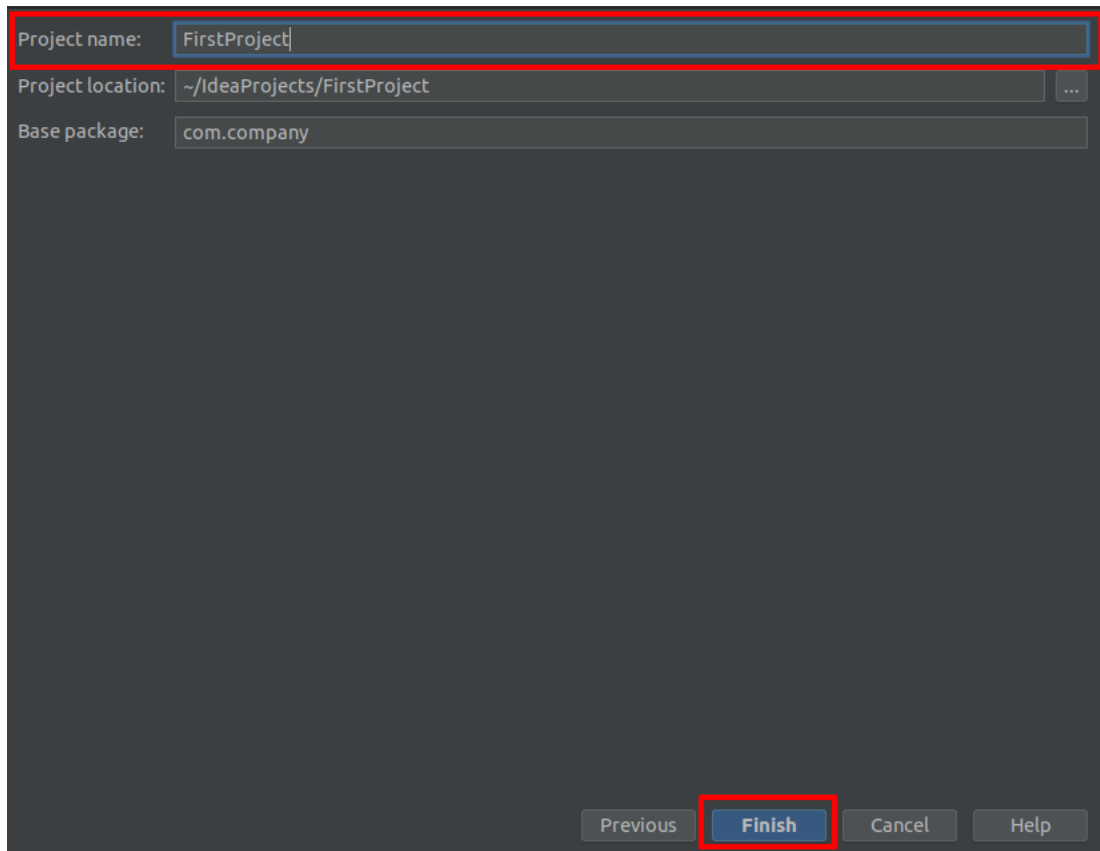

10. Once the download is complete, you need to select the recently downloaded JDK and click on next.

11. Choose the **create project from template** checkbox and then click next.

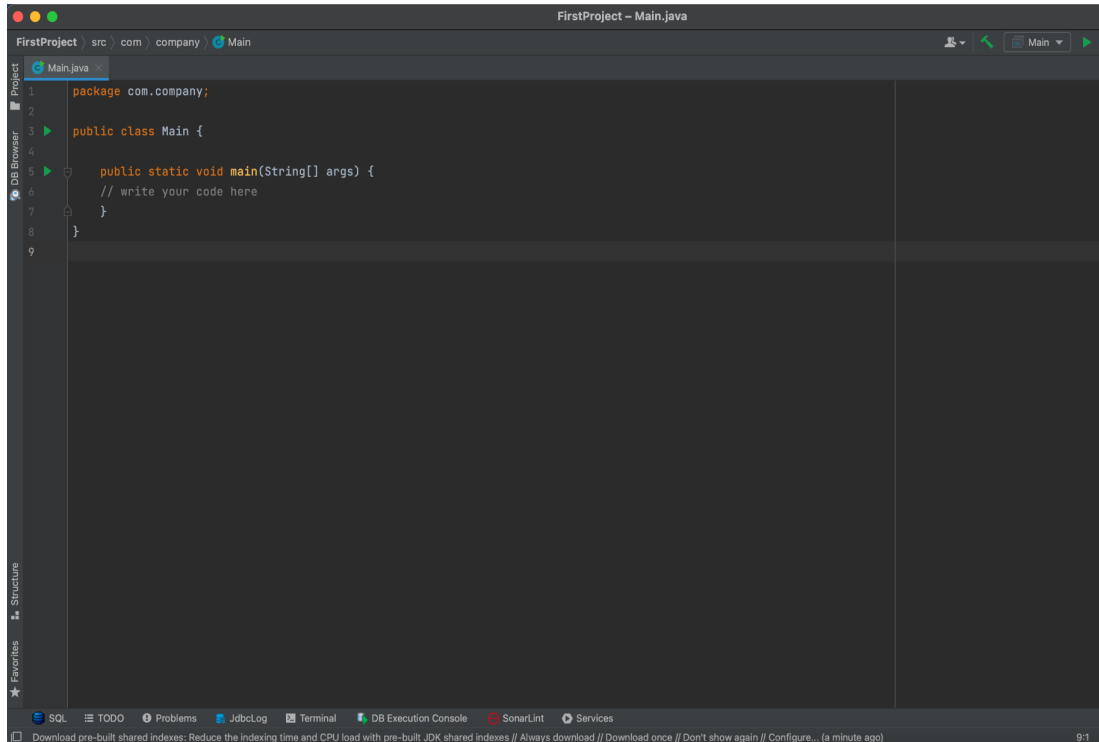

12. Name your project as **FirstProject** here and click finish.

The image shows a dark-themed dialog box for creating a new project. It has three input fields at the top: 'Project name:' with the text 'FirstProject', 'Project location:' with the text '~/IdeaProjects/FirstProject', and 'Base package:' with the text 'com.company'. The 'Project name' field is highlighted with a red border. At the bottom right, there are four buttons: 'Previous', 'Finish' (highlighted with a red border), 'Cancel', and 'Help'.

13. You will see a screen something like this where on the bottom right, some downloads are still continuing. Wait for the processes to finish in the event log. Now you can browse the IDE.

Congratulations !! You have now successfully installed and configured the IDE.
